

It's All About Your Data!

Mike Bihlmeier
CEO & President

With Computer Guidance Construction ERP you are in control of your financials and operational performance. Your jobs are completed on time and budget regardless of their diverse nature and complexity. Your data is transformed into invaluable information allowing you to see around corners, predict outcomes, make informed decisions and act smarter and faster than the competitors. Computer Guidance Construction ERP—eCMS is more than just a cost accounting and financial management solution. It is an integrated enterprise-class construction financial and project management solution that transforms your business-critical data into intelligence for smarter business.

The underlying benefit of an enterprise resource planning solution is its ability to bring together all aspects of a construction company under a single, unified database that captures daily activities from jobsites, back office and external resources. And, then, make those results immediately available to those who need it, when they need it, and where and how they need it. Computer Guidance Construction ERP is the solution that delivers this unified platform for the standardization and integration of business processes and data.

Computer Guidance customers leverage eCMS Construction ERP to capture and integrate business-critical data and make this information available throughout the entire organization by simply leveraging state-of-the-art

technology. Information is entered once in the system and displayed in multiple applications for different purposes and needs. While data alone is critical, Computer Guidance's ERP takes it many steps further by utilizing data to drive actions, create and manage fundamental business processes that serve as the heartbeat of the company's operations. As data is processed, eCMS Construction ERP translates it into intelligence that is used to draw insights and make informed decisions.

With the browser-based eCMS Construction ERP, your organization can capture mission-critical data, archive it, display it intelligently in multiple formats and disseminate it on demand. Having a web-based Construction ERP, Computer Guidance customers access their data anywhere and they benefit from a much lower cost of ownership than competitive products since there is no need for costly and complicated client software. For greater collaboration and better business decisions, Computer Guidance customers utilize an embedded BI solution for reports, dashboards, drill-downs, alerts and analytics that all support a transparent and seamless data exchange between users for optimized results.

And what makes it even more prevalent is that data is available when you need it the most. Since eCMS Construction ERP runs on the IBM platform, the reliability and security of your mission-critical applications and data are safeguarded by the IBM POWER7.

As at the end, it's all about your data that is used and re-used throughout each and every phase of the planning and management of a construction project. In the office, in the field and in the shop, teams are looking at different types of data for different purposes, but they all are leveraging the same ERP database to make it possible to work together seamlessly and in the most efficient. With a sound platform, industry-leading business intelligence and analytics, and browser-based ERP software with cloud-based deployment option, your information is available at your fingertips for running a better and smarter business.

It's all about your data. Now you need to determine how you are going to leverage it and access it. And that is up to the solution that you have in place.

Computer Guidance Corporation has been the trusted provider of construction ERP software for architecture, engineering and construction companies. Since its foundation in 1981, the company has been committed to setting industry standards in financial and project management software development for North America's leading construction companies.
