

Integration Suite

Application Overview

build effectively

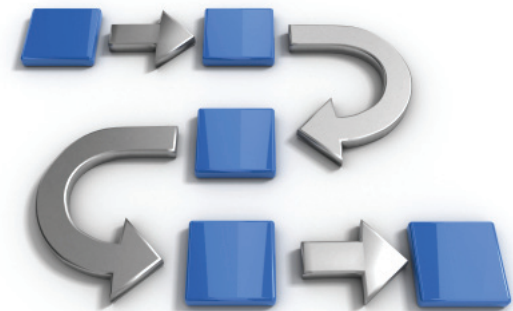

In today's business environment the utilization of multiple data sources to create information is a common requirement. Computer Guidance's Integration Suite application allows your business to bring in these data sources minimizing workloads while keeping data accurate and reliable. Data such as estimates, project information, plant tickets, equipment fuel entry, General Ledger entries, Accounts Payable, and payroll time entry populate prebuilt import files that will be validated prior to acceptance into the appropriate application. These import files are designed to allow editing before the upload is complete.

Interfaces

Integration Suite

Estimating Interfaces — Bid items, estimated costs (lump sum and quantities with unit costs), and units of measure are examples of estimating data that can be uploaded to the eCMS software. Standard interfaces with commercial estimating systems. If Excel is your estimating tool then Computer Guidance can work with you to create the output file to upload using the standard interface file. A “to/from” is available if additional mapping is required to take the job details from the way it was estimated and convert it to the way it is to be tracked.

Plant Sales & Direct Scale Interfaces – This interface is designed to retrieve data from your scale ticketing software, provide the pricing and hired trucker data in order to complete the cycle for billing and invoicing. Scale ticketing software from Aztec, WEM, Libra, JWS, Seltec, Cardinal, and others can create an export file that can be retrieved into eCMS for validation and editing if required. Data is validated before it is updated in eCMS.

Remote Time Entry Interfaces – Field payroll, remote time card entry and time and attendance information is collected and uploaded into eCMS for further payroll and job cost processing, leveraging same functionality as the online payroll entry and processing feature.

Other Interfaces – The Trade Services interface will import the parts list and pricing for your inventory items. Job Site Integration allows for data such as change orders, owner contract data, subcontracts, quantities installed, purchase orders, and other job documents to be imported from outside sources. These interfaces allow your organization to continue to use familiar products without sacrificing the requirement of data entered once and only once regardless of the source.
